**PHENYL HETEROCYCLES AS CYCLOOXYGENASE-2 INHIBITORS****BACKGROUND OF THE INVENTION**

5 This invention relates to compounds and pharmaceutical compositions for the treatment of cyclooxygenase mediated diseases and methods of treatment thereof.

Non-steroidal, antiinflammatory drugs exert most of their antiinflammatory, analgesic and antipyretic activity and inhibit hormone-induced uterine contractions and certain types of cancer growth through inhibition of prostaglandin G/H synthase, also known as cyclooxygenase. Up until recently, only one form of cyclooxygenase had been characterized, this corresponding to cyclooxygenase-1 or the constitutive enzyme, as originally identified in bovine seminal vesicles. Recently the gene for a second inducible form of cyclooxygenase (cyclooxygenase-2) has been cloned, sequenced and characterized from chicken, murine and human sources. This enzyme is distinct from the cyclooxygenase-1 which has now also been cloned, sequenced and characterized from sheep, murine and human sources. The second form of cyclooxygenase, cyclooxygenase-2, is rapidly and readily inducible by a number of agents including mitogens, endotoxin, hormones, cytokines and growth factors. As prostaglandins have both physiological and pathological roles, we have concluded that the constitutive enzyme, cyclooxygenase-1, is responsible, in large part, for endogenous basal release of prostaglandins and hence is important in their physiological functions such as the maintenance of gastrointestinal integrity and renal blood flow. In contrast, we have concluded that the inducible form, cyclooxygenase-2, is mainly responsible for the pathological effects of prostaglandins where rapid induction of the enzyme would occur in response to such agents as inflammatory agents, hormones, growth factors, and cytokines. Thus, a selective inhibitor of cyclooxygenase-2 will have similar antiinflammatory, antipyretic and analgesic properties to a conventional non-steroidal antiinflammatory drug,

and in addition would inhibit hormone-induced uterine contractions and have potential anti-cancer effects, but will have a diminished ability to induce some of the mechanism-based side effects. In particular, such a compound should have a reduced potential for gastrointestinal toxicity, a reduced potential for renal side effects, a reduced effect on bleeding times and possibly a lessened ability to induce asthma attacks in aspirin-sensitive asthmatic subjects.

### SUMMARY OF THE INVENTION

The invention also encompasses certain pharmaceutical compositions and methods for treatment of cyclooxygenase-2 mediated diseases comprising the use of compounds of Formula I.

- 26 -

The pharmaceutical compositions of the present invention comprise a compound of Formula I as an active ingredient or a pharmaceutically acceptable salt, thereof, and may also contain a pharmaceutically acceptable carrier and optionally other therapeutic ingredients. The term "pharmaceutically acceptable salts" refers to salts prepared from pharmaceutically acceptable non-toxic bases including inorganic bases and organic bases. Salts derived from inorganic bases include aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic salts, manganous, potassium, sodium, zinc, and the like. Particularly preferred are the ammonium, calcium, magnesium, potassium, and sodium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, and basic ion exchange resins, such as arginine, betaine, caffeine, choline, N,N\_-dibenzylethylenediamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, isopropylamine, lysine, methylglucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethylamine, trimethylamine, tripropylamine, tromethamine, and the like.

It will be understood that in the discussion of methods of treatment which follows, references to the compounds of Formula I are meant to also include the pharmaceutically acceptable salts.

The Compound of Formula I is useful for the relief of pain, fever and inflammation of a variety of conditions including rheumatic fever, symptoms associated with influenza or other viral infections, common cold, low back and neck pain, dysmenorrhea, headache, toothache, sprains and strains, myositis, neuralgia, synovitis, arthritis, including rheumatoid arthritis degenerative joint diseases (osteoarthritis), gout and ankylosing spondylitis, bursitis, burns, injuries, following surgical and dental procedures. In addition, such a compound may inhibit cellular

- 27 -

neoplastic transformations and metastatic tumor growth and hence can be used in the treatment of cancer. Compounds of formula I may also be useful for the treatment of dementia including pre-senile and senile dementia, and in particular, dementia associated with Alzheimer Disease (ie Alzheimer's dementia).

5           Compounds of formula I will also inhibit prostanoid-induced smooth muscle contraction by preventing the synthesis of contractile prostanoids and hence may be of use in the treatment of dysmenorrhea, premature labor and asthma.

10           By virtue of its high cyclooxygenase-2 (COX-2) activity and/or its selectivity for cyclooxygenase-2 over cyclooxygenase-1 (COX-1) as defined above, compounds of formula I will prove useful as an alternative to conventional non-steroidal antiinflammatory drugs (NSAID'S) particularly where such non-steroidal antiinflammatory drugs  
15           may be contra-indicated such as in patients with peptic ulcers, gastritis, regional enteritis, ulcerative colitis, diverticulitis or with a recurrent history of gastrointestinal lesions; GI bleeding, coagulation disorders including anemia such as hypoprothrombinemia, haemophilia or other bleeding problems (including those relating to reduced or impaired platelet  
20           function); kidney disease (eg impaired renal function); those prior to surgery or taking anticoagulants; and those susceptible to NSAID induced asthma.

          Similarly, compounds of formula I, will be useful as a partial or complete substitute for conventional NSAID'S in preparations wherein they are presently co-administered with other agents or ingredients. Thus  
25           in further aspects, the invention encompasses pharmaceutical compositions for treating cyclooxygenase-2 mediated diseases as defined above comprising a non-toxic therapeutically effective amount of the compound of Formula I as defined above and one or more ingredients such as another pain reliever including acetaminophen or phenacetin; a potentiator  
30           including caffeine; an H<sub>2</sub>-antagonist, aluminum or magnesium hydroxide, simethicone, a decongestant including phenylephrine,

- 28 -

phenylpropanolamine, pseudophedrine, oxymetazoline, ephinephrine, naphazoline, xylometazoline, propylhexedrine, or levo-desoxyephedrine; an antiitussive including codeine, hydrocodone, caramiphen, carbetapentane, or dextramethorphan; a diuretic; a sedating or non-sedating antihistamine. In addition the invention encompasses a method of treating  
5 cyclooxygenase mediated diseases comprising: administration to a patient in need of such treatment a non-toxic therapeutically effect amount of the compound of Formula I, optionally co-administered with one or more of such ingredients as listed immediately above.

10 Compounds of the present invention are inhibitors of cyclooxygenase-2 and are thereby useful in the treatment of cyclooxygenase-2 mediated diseases as enumerated above. This activity is illustrated by their ability to selectively inhibit cyclooxygenase-2 over  
15 cyclooxygenase-1. Accordingly, in one assay, the ability of the compounds of this invention to treat cyclooxygenase mediated diseases can be demonstrated by measuring the amount of prostaglandin E<sub>2</sub> (PGE<sub>2</sub>) synthesized in the presence of arachidonic acid, cyclooxygenase-1 or cyclooxygenase-2 and a compound of formula I. The IC<sub>50</sub> values represent the concentration of inhibitor required to return PGE<sub>2</sub> synthesis  
20 to 50 % of that obtained as compared to the uninhibited control. Illustrating this aspect, we have found that the Compounds of the Examples are more than 100 times more effective in inhibiting COX-2 than they are at inhibiting COX-1. In addition they all have a COX-2 IC<sub>50</sub> of 1 nM to 1  
25  $\mu$ M. By way of comparison, Ibuprofen has an IC<sub>50</sub> for COX-2 of 1  $\mu$ M, and Indomethacin has an IC<sub>50</sub> for COX-2 of approximately 100 nM. For the treatment of any of these cyclooxygenase mediated diseases, compounds of formula I may be administered orally, topically, parenterally, by inhalation spray or rectally in dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers,  
30 adjuvants and vehicles. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection

- 29 -

or infusion techniques. In addition to the treatment of warm-blooded animals such as mice, rats, horses, cattle sheep, dogs, cats, etc., the compound of the invention is effective in the treatment of humans.

As indicated above, pharmaceutical compositions for treating cyclooxygenase-2 mediated diseases as defined may optionally include one or more ingredients as listed above.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the technique described in the U.S. Patent 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid

- 30 -

diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredients is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

5 Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethyl-cellulose, methylcellulose, hydroxy-propylmethycellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for  
10 example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethylene-oxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters  
15 derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose, saccharin or aspartame.

20 Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above,  
25 and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active  
30 ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents

- 31 -

and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

5 The pharmaceutical compositions of the invention may also be in the form of an oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said  
10 partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavouring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such  
15 formulations may also contain a demulcent, a preservative and flavoring and coloring agents. The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been  
20 mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed  
25 oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Compounds of formula I may also be administered in the form  
30 of a suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-

- 32 -

irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, creams, ointments, jellies, solutions or suspensions, etc., containing the compound of Formula I are employed. (For purposes of this application, topical application shall include mouth washes and gargles.)

Dosage levels of the order of from about 0.01 mg to about 140 mg/kg of body weight per day are useful in the treatment of the above-indicated conditions, or alternatively about 0.5 mg to about 7 g per patient per day. For example, inflammation may be effectively treated by the administration of from about 0.01 to 50 mg of the compound per kilogram of body weight per day, or alternatively about 0.5 mg to about 3.5 g per patient per day, preferably 2.5 mg to 1 g per patient per day.

The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. For example, a formulation intended for the oral administration of humans may contain from 0.5 mg to 5 g of active agent compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95 percent of the total composition. Dosage unit forms will generally contain between from about 1 mg to about 500 mg of an active ingredient, typically 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

### Methods of Synthesis

- 33 -

The compounds of the present invention can be prepared according to the following methods.

Method A:

5       The  $\beta$ -chlorovinylaldehyde III can be obtained from the ketone II and the Vilsmeier reagent (DMF-POCl<sub>3</sub>) using the general method described by Weissenfels (Z. Chem. 1966, 6, 471). The thiophene compound IV is obtained from III using the general method described by Weissenfels (Z. Chem., 1973, 13, 57). The thiol compound V can be  
10       obtained after oxidation of compound IV ( $R^a = -SMe$ ) with one equivalent of m-CPBA followed by treatment of the resulting sulfoxide with TFAA at reflux. The sulfonamide group (VI) can then be formed by the method of Kharash (J. Amer. Chem. Soc. 1951, 73, 3240). The hydrolysis of compound VI and decarboxylation with Cu bronze in quinoline provides compound VII. Compound VII ( $R^4 = H$ ) can be treated with halogenating  
15       agent such as bromine in acetic acid to allow the preparation of the 5-bromothiophene (VII,  $R^4 = Br$ ). When it is desired to have a nitrile group at C-5, this can be accomplished from VI via amide formation using the Weinreb methodology (Tetrahedron Letters, 1977, 4171) followed by dehydration with TFAA. The CF<sub>3</sub> group can be introduced at C-5 of VII  
20       via the method of Girard (J. Org. Chem. 1983, 48, 3220).

      The introduction of an alkyl group at C-5 can be achieved via a Friedel-Crafts reaction on VII ( $R^4 = H$ ) and an acyl chloride, Cl-CO-lower alkyl and a catalyst such as TiCl<sub>4</sub>, followed by reduction. For  
25        $R^4 = Me$ , this can be achieved from the ester ( $R^4 = CO_2Me$ ) via a DIBAL-H reduction followed by deoxygenation using the method of Lau (J. Org. Chem. 1986, 51, 3038). Tertiary alcohols ( $R^4 = -C(CH_3)_2OH$ ) can be  
      obtained from VI and MeMgBr. These tertiary alcohols can also be deoxygenated using the method of Lau. Similarly, the thiophene IX can be  
30       prepared from ketone VIII.

- 34 -

## METHOD A

- 35 -

## METHOD A CONT'D

Method B:

Ketone X can be converted to the thiophene compound XI using general methods already described in Method A. The thiophene XII can be prepared by metallation of XI with n-BuLi, quenching with methyl phosphonic dichloride and addition of water or ammonia ( $\text{X}' = \text{OH}$  or  $\text{NH}_2$ ). Similarly, the other regioisomer XIV can be prepared from ketone XIII.

- 36 -

## METHOD B

25 Method C:

Bromination of ketone II gives the  $\alpha$ -bromoketone XV which is then converted to the thiazole XVI after treatment with a thioamide. Similarly, ketone VIII can be converted to thiazole XVII.

30

- 37 -

## METHOD C

Method D:

25 Ketone XV can be converted to the imidazole compound XVIII after treatment with formamide using the preparation of Brederick et al, Chem. Ber. 1953, p. 88.

30

- 38 -

## METHOD D

Method E:

10 Pyrole compound XX can be obtained from diketone XIX using the general procedures of Friedman et al, J. Org. Chem. 1965, 30, p. 854, K. Dimroth et al, Ber. 1956, 56, 2602, K. Dimroth et al, Ann. 1961, 634, 102. The free NH of the pyrole can be acylated with Cl-CO-lower alkyl in the presence of a base such as Et<sub>3</sub>N. Also alkylated products can be prepared using alkyl halides as reagents with a base such as NaH.

15

## METHOD E

- 39 -

Method F:

The compounds of type XXV can be prepared from readily available 4-substituted phenylacetyl chlorides XXIa. Reaction of di(3-butenyl)cadmium with a 4-substituted phenylacetyl chloride provides ketone XXI. Ozonolysis of XXI affords keto aldehyde XXIb which is cyclized by base to give cyclopentenone XXII. Addition of arylmagnesium bromide or aryllithium to XXII gives allylic alcohol XXIV. Oxidation of XXIV with pyridinium chlorochromate affords the desired 2,3-disubstituted cyclopentenone XXV. For preparation of compound XXV ( $R^1=SO_2Me$ ), 4-methylthiophenyllithium is used followed by oxidation with the magnesium salt of monoperoxyphthalic acid (MMPP) or m-chloroperoxybenzoic acid (mCPBA) to introduce the required methylsulfonyl group in XXV.

- 40 -

## METHOD F

**Method G:**

The sequence of Method G is the same as in Method F except R<sup>1</sup> containing acid chloride is used as starting material. R<sup>2</sup> is introduced at a later stage via a carbonyl addition reaction, followed by PCC oxidation.

## METHOD G

25 Method H:

The 4,5-disubstituted isothiazoles and isothiazol-3(2H)-one-1,1-dioxides can be prepared by the general method described by B. Schulze et al, Helvetica Chimica Acta, 1991, 74, 1059. Thus, aldehyde III (R<sup>a</sup>=SO<sub>2</sub>Me) or XXVII is treated with excess NH<sub>4</sub>SCN in refluxing

30 acetone to provide the corresponding 4,5-disubstituted isothiazoles XXX.

Methyl 2-hydroxy isobutyrate is silylated with TMSCl to give the TMS ether XLI, which is treated with 4-methylthiophenyllithium to provide ketone XLII. Desilylation followed by acylation yields keto-ester XLIV, which can be cyclized to lactone XLV by base catalysis. Oxidation of XLV with MMPP or mCPBA affords the desired product XLVI.

## METHOD L

## METHOD M

10 An alternative preparation of the hydroxy ketone XLIII is the oxidation of the known (J. Org. Chem. 1991 56, 5955-8; Sulfur Lett. 1991, 12, 123-32) ketone XLVII. A mixture of XLVII, aqueous base, such as NaOH, organic solvents such as carbon tetrachloride/toluene and a phase transfer catalyst such as ALIQUAT 336 is stirred in air at room

15 temperature to provide XLIII. Compound XLIII is also described in U.S. 4,321,118 and Org. Coat. 1986, 6, 175-95.

## Method N

30 By reacting an acetylene XLVIII with carbon monoxide and water in the presence of suitable catalysts, a mixture of compound XXXIII and its isomer XXXV is obtained. The isomers are separable by standard procedures in the art such as chromatography or crystallization. Examples of useful catalysts and conditions are PdCl<sub>2</sub> in aqueous HCl and EtOH,

- 48 -

heated at 50-150°C and 50-150 atmospheres of pressure, or  $\text{Rh}_4(\text{CO})_{12}$  (or  $\text{Rh}_6(\text{CO})_{16}$ ) in aqueous THF (or acetone, acetonitrile, benzene, toluene, EtOH, MeOH) containing a trialkylamine, at 50-150°C and 20-300 atmospheres pressure. See Takahashi et al., *Organometallics* **1991**, *10*, 2493-2498; and Tsuji et. al., *J. Am. Chem. Soc.* **1966**, *88*, 1289-1292.

## Method O

1, 4-Addition to XLIX of 4-methylthiophenyl organometallic reagents **L** in the presence of copper salts and the trapping of the resultant enolate with trialkyl silyl chloride such as  $\text{TMSCl}$  or  $\text{TIPSCl}$  provide the ketene acetal **LI**. The ketene acetal can then be oxidized to the substituted butenolide **LII** by the method of Ito using catalytic amounts of  $\text{Pd}_2(\text{OAc})_2$  and  $\text{Cu}(\text{OAc})_2$  and  $\text{O}_2$  in MeOH or by the method of Magnus using

- 49 -

and Cu(OAc)<sub>2</sub> and O<sub>2</sub> in MeOH or by the method of Magnus using PhIO/TMSN<sub>3</sub> and Bu<sub>4</sub>NF. Introduction of the iodine can be accomplished by treating LII with I<sub>2</sub> in the presence of pyridine to afford LIII.

Palladium catalyzed Susuki or Stille coupling of LIII with the appropriate aryl or alkyl partner such as the boronic acid LIV provides the butenolide LV. The sulfide can be oxidized to a sulfone by various oxidizing agents such as peracetic acid, MPPM, MMPP or H<sub>2</sub>O<sub>2</sub> to give the desired compound LVI. See Y. Ito et. al., *J. Am. Chem. Soc.* **1979**,101, 494; and P. Magnus et. al., *Tet. Lett.* **1992**, 2933.

### Assays for Determining Biological Activity

The compound of Formula I can be tested using the following assays to determine their cyclooxygenase-2 inhibiting activity.

#### 5 Inhibition of Cyclooxygenase Activity

Compounds were tested as inhibitors of cyclooxygenase activity in whole cell and microsomal cyclooxygenase assays. Both of these assays measured prostaglandin E<sub>2</sub> (PGE<sub>2</sub>) synthesis in response to arachidonic acid, using a radioimmunoassay. Cells used for whole cell  
10 assays, and from which microsomes were prepared for microsomal assays, were human osteosarcoma 143 cells (which specifically express cyclooxygenase-2) and human U-937 cells (which specifically express cyclooxygenase-1). In these assays, 100% activity is defined as the difference between prostaglandin E<sub>2</sub> synthesis in the absence and presence  
15 of arachidonate addition. IC<sub>50</sub> values represent the concentration of putative inhibitor required to return PGE<sub>2</sub> synthesis to 50% of that obtained as compared to the uninhibited control. Representative results are shown in Table III.

#### 20 Representative Rat Paw Edema Assay – Protocol

Male Sprague-Dawley rats (150-200g) were fasted overnight and were given po either vehicle (5% tween 80 or 1% methocel) or a test compound at 9 - 10 am. One hr later, a line was drawn using a permanent  
25 marker at the level above the ankle in one hind paw to define the area of the paw to be monitored. The paw volume (V<sub>0h</sub>) was measured using a plethysmometer (Ugo-Basile, Italy) based on the principle of water displacement. The animals were then injected subplantarily with 50 ul of a  
30 1% carrageenan solution in saline (FMC Corp, Maine) into the paw using an insulin syringe with a 25-gauge needle (i.e. 500 ug carrageenan per paw). Three hr later, the paw volume (V<sub>3h</sub>) was measured and the

- 81 -

increases in paw volume ( $V_{3h} - V_{0h}$ ) were calculated. The animals were euthanized by CO<sub>2</sub> asphyxiation and the absence or presence of stomach lesions scored. Stomach scores were expressed as the sum of total lesions in mm. Paw edema data were compared with the vehicle-control group and percent inhibition calculated taking the values in the control group as 100%. Since a maximum of 60 - 70% inhibition (paw edema) was obtained with standard NSAIDs, ED<sub>30</sub> values were used for comparison. All treatment groups were coded to eliminate observer bias. With this protocol, the ED<sub>30</sub> for Indomethacin is 1.0 mg/kg. Representative results are shown in Table IV.

EXAMPLE 13-(4-Aminosulfonyl)phenyl)-2-(4-fluorophenyl)-5-(2-hydroxy-2-propyl)thiophene

- 5    Step 1:    1-(4-Fluorophenyl)-2-(4-(methylthio)phenyl)ethanone  
To 4-fluorobenzaldehyde (5.40 g) in 1,2-dichloroethane (43.50 mL) were added TMS-CN (4.32 g) and ZnI<sub>2</sub> (44 mg). After 0.5 h at r.t., the solvent was removed *in vacuo*. To the resulting TMS cyanohydrin (9.20 g) in THF (42.0 mL) at -78°C was added dropwise a  
10    solution of LDA 0.51M in THF (88.9 mL). After a period of 0.5 h, a THF solution (30.0 mL) of 4-(chloromethyl)thioanisole (9.93 g) was added dropwise over 0.5 h. After 18 h at +5°C, the resulting mixture was treated with TBAF (57.5 mL) followed by a 25% aqueous solution of NH<sub>4</sub>OAc (100 mL) and extracted with EtOAc (2 x 150 mL). After  
15    evaporation, a 10:1 mixture of Et<sub>2</sub>O and hexane (200 mL) was added to the crude ketone. After stirring for 10 h and filtration, the title product was obtained as a solid by filtration (2.40 g).  
1H NMR (CD<sub>3</sub>COCD<sub>3</sub>): δ 2.45 (3H, s), 4.34 (2H, s), 7.19-7.29 (6H, m), 8.14 (2H, q).

- 20    Step 2:    Cis,trans-3-chloro-3-(4-fluorophenyl)-2-(4-(methylthio)-phenyl)propenal  
To a solution of 1-(4-fluorophenyl)-2-(4-(methylthio)phenyl ethanone (2.50 g) in 1,2-dichloroethane (27.0 mL) were introduced the  
25    Vilsmeier reagent (Aldrich catalog, 1992-1993) 3.3M (11.6 mL) and DMAP (1.17 g). After a period of 4 h at 80°C, the reaction mixture was extracted with EtOAc and 25% aqueous solution of NH<sub>4</sub>OAc. After evaporation *in vacuo* and drying for a few hours, the title product was used as such for the next step.  
30    1H NMR (CD<sub>3</sub>COCD<sub>3</sub>): δ 2.40 and 2.48 (3H, 2s), 6.90-7.80 (8H, m), 9.55 (1H, s).

EXAMPLE 2315 3-(Phenyl)-4-(4-(methylsulfonyl)phenyl)-2-(5H)-furanone

To a solution of phenylacetic acid (27.4 g, 201 mmol) and 2-bromo-1-(4-(methylsulfonyl)phenyl)ethanone (Example 9, Step 1) (60 g, 216 mmol, 1.075 eq.) in acetonitrile (630 mL) at 25°C was added slowly triethylamine (30.8 mL, 1.1 eq.). The mixture was stirred for 20 min. at  
20 room temperature and then cooled in an ice bath. DBU (60.1 mL, 3 eq.) was slowly added. After stirring for 20 min. in the ice bath, the reaction was complete and the mixture was acidified with 1N HCl (color changes from dark brown to yellow). Then 2.4 L of ice and water were added, stirred for a few minutes, then the precipitate was filtered and rinsed with  
25 water (giving 64 g of crude wet product). The solid was dissolved in 750 mL of dichloromethane (dried over MgSO<sub>4</sub>, filtered) and 300 g of silica gel was added. The solvent was evaporated to near dryness (silica gel a bit sticky) and the residue was applied on top of a silica gel plug (sintered glass funnel) eluted with 10% EtOAc/CH<sub>2</sub>Cl<sub>2</sub>, giving after evaporation of the  
30 solvent and swish in ethyl acetate, 36.6 g (58%) of the title compound.

15 3-(Phenyl)-4-(4-(methylsulfonyl)phenyl)-2-(5H)-furanone

                 Into a 20 ml glass ampule are added 1 g of 2-(4-(methylsulfonyl)phenyl)phenylacetylene, 20 mg of Rh<sub>4</sub>(CO)<sub>12</sub>, 1.5 g of Et<sub>3</sub>N, 10 ml of THF, 1 ml of water under nitrogen atmosphere, and the ampule is placed in a 100-ml stainless steel autoclave. The reaction system is flushed three times with CO then charged at room temperature to a  
20 initial CO pressure of 100 atm. The reaction is carried at 100 °C for 5 h. The solution is then diluted with 50 ml of benzene and washed with brine, 1N HCl. The benzene solution is dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated. The crude products are separated by column chromatography on silica gel  
25 eluted with 2:1 EtOAc/hexane to give the title compound and its regioisomer.

EXAMPLE 56

30 3-(Phenyl)-4-(4-(methylsulfonyl)phenyl)-2-(5H)-furanone

Step 1:      2-trimethylsilyloxy-4-(4-(methylthio)phenyl)-3,4-dihydrofuran

- 131 -

To a solution of 3.86 g (19 mmol) of 4-bromothioanisole in 90 mL of Et<sub>2</sub>O cooled at -78°C, is added 22 mL of 1.7 M solution of t-BuLi in pentane (38 mmol) dropwise. The reaction mixture is stirred for 15 min at -78°C and 3.8 g of CuI is added and the reaction mixture is allowed to warm to -40 °C over a period of 30 min. A solution of 1.7 g of 2(5H)-furanone in 10 ml of THF is added. After stirring for 1 h, 2 ml of freshly distilled TMSCl is added dropwise. The reaction mixture is then treated with 2 ml of Et<sub>3</sub>N and 50 ml of sat. NaHCO<sub>3</sub>, and extracted with 100 ml of ether. The ether layer is dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated to the crude title compound which is used for the next step without further purification.

Step 2: 4-(4-(methylthio)phenyl)-2-(5H)-furanone

To a solution of 4 g of Pd(OAc)<sub>2</sub> in 100 ml of acetonitrile is added dropwise the crude product from Step 1 (5 g) under nitrogen at room temperature. After 10 h at room temperature, the mixture is condensed under reduced pressure and the residue is purified by flash chromatography on silica gel eluted with 2:1 hexane/EtOAc to give the title compound.

Step 3: 3-iodo-4-(4-(methylthio)phenyl)-2-(5H)-furanone

To a solution of 3 g of the product of Step 2 in 30 ml of pyridine is added 8.7 g of I<sub>2</sub>. The mixture is stirred for 24 h and then diluted with 200 ml of ether, washed with 100 ml of 5N HCl and 50 ml of 5N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. The ether layer is dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated to give the title compound.

Step 4: 3-(Phenyl)-4-(4-(methylthio)phenyl)-2-(5H)-furanone

A mixture of 4 g of the product of Step 3, 3.7 g of PhB(OH)<sub>2</sub>, 0.4 g of Ph<sub>3</sub>As, 0.4 g of PdCl<sub>2</sub>(PhCN)<sub>2</sub> in 100 ml of benzene and 15 ml of

- 132 -

2N NaOH is refluxed for 6 h. Ether(200 ml) is then added and the mixture is washed with 100 ml of saturated NaHCO<sub>3</sub>. The organic layer is dried over MgSO<sub>4</sub> and concentrated. The residue is purified by flash chromatography on silica gel eluted with 4:1 hexane/EtOAc to give the title compound.

5

Step 5: 3-(Phenyl)-4-(4-(methylsulfonyl)phenyl)-2-(5H)-furanone

10

To a solution of 3 g of the product of Step 4 in 80 mL of 10:1 CH<sub>2</sub>Cl<sub>2</sub>/MeOH is added 5.5 g of MPPM. The reaction mixture is stirred at room temperature for 2 h and then diluted with 100 mL of 1:1 hexane/EtOAc. After filtration and concentration, the residue is purified by flash chromatography eluted with 2:1 EtOAc/hexane to give the title product.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/CA94/00318

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
  
Please see attached sheet ./.
  
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**B x II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/

**iii) Incomplete search**

In the light of the variety of (hetero)cyclic rings and the nature of their substituents, a meaningful search of the subject-matter of the claims 1-18, 27-33 could not be carried out (Article 17 (2)(a)(ii) PCT). The search has been limited to the examples, i.e. to the exemplified heterocyclic rings substituted with an additional phenyl ring or cyclohexyl adjacent to the sulfonyl-substituted phenyl.
